Top Quark Mass Prediction

Only $\lambda_t = \langle Q t_L^c H \rangle = \sqrt{2}g$ at $N = 3$

mass of lighter quarks and leptons \rightarrow nonrenormalizable terms

$$\longrightarrow \lambda_b = \lambda_\tau = 0.35g^3 \sim \frac{1}{8}\lambda_t$$

Evolve λ_t , λ_b to low energies

$$m_t = \lambda_t v_1 = \lambda_t \frac{v_0}{\sqrt{2}} \sin \beta \quad m_b = \lambda_b v_2 = \lambda_b \frac{v_0}{\sqrt{2}} \cos \beta$$

where $v_0 = \frac{2m_W}{g_2(M_Z)} = 246\text{GeV}$ and $v_1^2 + v_2^2 = \frac{v_0^2}{2}$

$$m_t = \lambda_t(m_t) \frac{v_0}{\sqrt{2}} \frac{\tan \beta}{(1 + \tan^2 \beta)^{\frac{1}{2}}} \implies$$

Hierarchical top–bottom mass relation in a superstring derived standard-like model

Alon E. Faraggi

*Center For Theoretical Physics, Texas A&M University, College Station, TX 77843-4242, USA
and Astroparticle Physics Group, Houston Advanced Research Center (HARC), The Woodlands, TX 77381, USA*

Received 30 September 1991

I propose a mechanism in a class of superstring standard-like models which explains the mass hierarchy between the top and bottom quarks. At the trilinear level of the superpotential only the top quark gets a nonvanishing mass term while the bottom quarks and tau lepton mass terms are obtained from nonrenormalizable terms. I construct a model which realized this mechanism. In this model the bottom quark and tau lepton Yukawa couplings are obtained from quartic order terms. I show that $\lambda_b = \lambda_\tau \sim \frac{1}{3}\lambda_t$ at the unification scale. A naive estimate yields $m_t \sim 175\text{--}180$ GeV.

One of the unresolved puzzles of the standard model is the mass splitting between the top quark and the lighter quarks and leptons. Especially difficult to understand within the context of the standard model is the big splitting in the heaviest generation. Experimental limits [1] indicate the top mass to be above 80 GeV, while the bottom and tau lepton masses are found at 5 GeV and 1.78 GeV respectively. Possible extensions to the standard model are grand unified theories. Although the main prediction of GUTs, proton decay, has not yet been observed, calculations of $\sin^2\theta_w$ and of the mass ratio m_b/m_τ support their validity. Recent calculations seem to support supersymmetric GUTs versus nonsupersymmetric ones [2]. In spite of the success of SUSY GUTs in confronting LEP data [2], an understanding of the mass splitting between the top quark and the lighter quarks and leptons is still lacking. The next level in which such an understanding may be developed is in the context of superstring theory [3].

Towards String Predictions

1. Low energy supersymmetry

Specific SUSY breaking patterns \longrightarrow Collider implications

2. Additional (non-GUT) gauge bosons

Proton Stability and low-scale Z' \longrightarrow Collider signatures

3. Exotic matter

In realistic string models

Unifying gauge group \Rightarrow broken by “Wilson lines”.

\Rightarrow non-GUT physical states.

\Rightarrow Meta-stable heavy string relics

\rightarrow Dark Matter ; UHECR candidates
