1(a). We have

$$\begin{aligned}
\langle \psi_p^{(r)}, \tilde{\psi}_{p'}^{(s)} \rangle &= \int d^3 \mathbf{x} \sqrt{p^0 + m} \sqrt{p'^0 + m} e^{ip \cdot x} e^{ip' \cdot x} \left(\chi_r^\dagger \quad \chi_r^\dagger \frac{\sigma \cdot \mathbf{p}}{p^0 + m} \right) \left(\frac{\sigma \cdot \mathbf{p}'}{p'^0 + m} \chi_s \right) \\
&= \int d^3 \mathbf{x} \sqrt{p^0 + m} \sqrt{p'^0 + m} e^{i(p^0 + p'^0)x^0} e^{-i(\mathbf{p} + \mathbf{p}') \cdot \mathbf{x}} \\
&\quad \left(\chi_r^\dagger \frac{\sigma \cdot \mathbf{p}'}{p^0 + m} \chi_s + \chi_r^\dagger \frac{\sigma \cdot \mathbf{p}}{p^0 + m} \chi_s \right) \\
&= \sqrt{p^0 + m} \sqrt{p'^0 + m} e^{i(p^0 + p'^0)x^0} (2\pi)^3 \delta(\mathbf{p} + \mathbf{p}') \\
&\quad \left(\chi_r^\dagger \frac{\sigma \cdot \mathbf{p}'}{p^0 + m} \chi_s + \chi_r^\dagger \frac{\sigma \cdot \mathbf{p}}{p^0 + m} \chi_s \right) \\
&= (2\pi)^3 (p^0 + m) e^{2ip^0} \left(-\chi_r^\dagger \frac{\sigma \cdot \mathbf{p}}{p^0 + m} \chi_s + \chi_r^\dagger \frac{\sigma \cdot \mathbf{p}}{p^0 + m} \chi_s \right) \\
&= 0.
\end{aligned}$$

Taking the hermitian conjugate of this result, we also have

$$\langle \tilde{\psi}_p^{(r)}, \psi_{p'}^{(s)} \rangle = 0,$$

and we can also derive (in the same way as for $\langle \psi_p^{(r)}, \psi_{p'}^{(s)} \rangle$)

$$\langle \tilde{\psi}_p^{(r)}, \tilde{\psi}_{p'}^{(s)} \rangle = \delta_{rs} 2p^0 (2\pi)^3 \delta(\mathbf{p} - \mathbf{p}').$$

Taking the scalar product of $\tilde{\psi}_p^{(s)}$ with

$$\psi(x) = \frac{1}{(2\pi)^3} \sum_{r=1}^2 \int \frac{d^3 \mathbf{p}'}{2p'^0} [\psi_{p'}^{(r)}(x) a_r(\mathbf{p}') + \tilde{\psi}_{p'}^{(r)}(x) b_r^\dagger(\mathbf{p}')],$$

we find

$$\begin{aligned}
\langle \tilde{\psi}_p^{(s)}, \psi \rangle &= \frac{1}{(2\pi)^3} \sum_{r=1}^2 \int \frac{d^3 \mathbf{p}'}{2p'^0} [\langle \tilde{\psi}_p^{(s)}, \psi_{p'}^{(r)} \rangle a_r(\mathbf{p}') + \langle \tilde{\psi}_p^{(s)}, \tilde{\psi}_{p'}^{(r)} \rangle b_r^\dagger(\mathbf{p}')] \\
&= \frac{1}{(2\pi)^3} \sum_{r=1}^2 \int \frac{d^3 \mathbf{p}'}{2p'^0} \delta_{rs} 2p^0 (2\pi)^3 \delta(\mathbf{p} - \mathbf{p}') b_r^\dagger(\mathbf{p}') \\
&= b_s^\dagger(\mathbf{p}),
\end{aligned}$$

i.e. $b_s^\dagger(\mathbf{p}') = \int d^3 \mathbf{x}' \tilde{\psi}_{p'\beta}^{(s)\dagger}(x') \psi_\beta(x')$,

and therefore

$$b_r(\mathbf{p}) = \langle \psi, \tilde{\psi}_p^{(r)} \rangle = \int d^3 \mathbf{x} \psi_\alpha^\dagger(x) \tilde{\psi}_{p\alpha}^{(r)}(x).$$

So

$$\begin{aligned}
\{b_r(\mathbf{p}), b_s^\dagger(\mathbf{p}')\} &= \int d^3\mathbf{x} d^3\mathbf{x}' \tilde{\psi}_{p'\beta}^{(s)\dagger}(x') \tilde{\psi}_{p\alpha}^{(r)}(x) \{\psi_\beta(x'), \psi_\alpha^\dagger(x)\} \\
&= \int d^3\mathbf{x} d^3\mathbf{x}' \tilde{\psi}_{p'\beta}^{(s)\dagger}(x') \tilde{\psi}_{p\alpha}^{(r)}(x) \delta_{\alpha\beta} \delta(\mathbf{x} - \mathbf{x}') \\
&= \int d^3\mathbf{x} \tilde{\psi}_{p'\alpha}^{(s)\dagger}(x) \tilde{\psi}_{p\alpha}^{(r)}(x) \\
&= \langle \tilde{\psi}_{p'}^{(s)}, \tilde{\psi}_p^{(r)} \rangle \\
&= \delta_{rs} 2p^0 (2\pi)^3 \delta(\mathbf{p} - \mathbf{p}').
\end{aligned}$$

- (b) I'll give here the correct derivation, which requires a slight (but crucial) modification in the definition of P^μ .
